JSTOR Seeklight now has an AI-compatible schema and it appears that older schemas like the JSTOR metadata schema is no longer Seeklight compatible. Is that accurate?

Yes, that's accurate. JSTOR Seeklight now requires an AI-compatible schema, specifically a Dublin Core-based one designed for its AI metadata generation. Older schemas, including the previous JSTOR metadata schema, are no longer compatible for Seeklight's automated processing, as metadata can only be generated for this new schema.[1] [2] [3]

Schema Details

Seeklight uses an "AI-compatible Dublin Core template," which is mandatory for projects involving its AI tools like metadata generation and transcription.[4] [1]
Fields in these projects cannot be freely added, edited, or removed, limiting flexibility to ensure AI outputs align with standards.[3]
This shift supports Seeklight's human-in-the-loop workflow within JSTOR Digital Stewardship Services.[5]

Implications

Users must create Seeklight-compatible projects for AI features, storing generated metadata for review and editing.[2]
Non-AI projects may still use legacy schemas, but Seeklight functionality is restricted to the new one.[6]
This design prioritizes ethical AI use and archivist control.[7]
